Progress Since Customer Day 2

Since Customer Day 02, the team has made significant progress across both the frontend and backend components of the platform. We refined the storyline concept and redesigned several UI elements to better align with the client's expectations. The feedback interface and sprite interactions were updated for improved clarity and engagement. On the backend, we began integrating Supabase to support data storage for survey questions, feedback, and themes, and initiated development of the administrative dashboard. These updates collectively enhance the overall user flow and lay the foundation for the features to be showcased on Customer Day 03.

Hosting

As discussed during Customer Day 01, the team has chosen GitHub for codebase management and Render for hosting the web application.

Backend

To support our application, the team has selected Supabase as our database platform. It will be used to store survey questions, user feedback, and game themes, with plans to extend the database structure as the system evolves.

Figure 2: ERD Diagram

Design: Gamified Survey

Following the feedback provided during Customer Day 02, our team refined the user interface to better align with the client's expectations. As a result, several key design elements have been updated.

Some of the key points highlighted by the clients were the removal of user information (e.g. phone number), change in UI colour and font.

Figure 3: Old Wireframe

Old Quest List	Redesigned Quest List
The wireframe shows a vertical list of tasks on a dark background. At the top is the title 'QUEST LIST'. Below it is a progress indicator with four dots, the first of which is filled. The tasks are: 'TASK #1' (800 POINTS) 'HEAD TO THE BOOTH' with a 'SCAN QR' button; 'TASK #2' (800 POINTS) 'HEAD TO THE OTHER BOOTH' with a 'SCAN QR' button; 'TASK #3' (800 POINTS) 'HEAD TO THE LAST BOOTH' with a 'SCAN QR' button; and 'FEEDBACK' (800 POINTS) 'SHARE WITH US WHAT YOU THINK' with a 'SHARE FEEDBACK' button.	The redesigned wireframe has a light purple background. At the top is the title 'AVAILABLE TASKS' in a pixelated font, followed by the subtitle 'PUNGGOL COAST AWARENESS EVENT'. There are two task cards. The first card is titled 'THE LOST SWORD' and contains the text 'EMBARK ON A QUEST TO FIND THE LEGENDARY LOST SWORD OF ELDORIA.' with a 'SCAN QR' button. The second card is titled 'DRAGON'S TREASURE' and contains the text 'SEEK OUT THE ANCIENT DRAGON'S HOARD HIDDEN IN THE MOUNTAINS.' with a 'SCAN QR' button.

Design: Dashboard

The team has also begun developing the administrative dashboard for managing the gamified survey platform. This dashboard will enable administrators to update themes, modify survey questions, and access survey analytics.

You may view the demonstration for our dashboard here:

https://drive.google.com/file/d/1PqMRDObwk5ZBIgm2LRVQP3YX5R2PLGC_/view?resourcekey

Next Deliverables

During Customer Day 03, the client provided several points of feedback to help refine the system for the final showcase. They highlighted that the current survey questions are still too generic and should be updated to better reflect the intended purpose. They also requested that we finalise and implement a clear storyline for the user journey. While the colour scheme was approved, the body font may require adjustment to improve readability. The client noted that using a QR code for SCS events is acceptable, but external events with only a single booth may require alternative access mechanics. For the administrative dashboard, they suggested designing it for desktop use and incorporating additional analytics, such as completion drop-off rates. Lastly, they recommended implementing a monthly backup cycle for data safety. These points will guide our next set of deliverables.

The following will be the team's next deliverables based on the client's feedback.

Storyline

The feedback system will be structured around a narrative-driven experience that connects all events hosted by the Singapore Cancer Society into a single, continuous storyline. Instead of treating each event's feedback as an isolated form, users will become participants in an evolving story that unfolds as they complete different questionnaires. This approach transforms feedback collection into a purposeful journey encouraging users to stay engaged and complete the entire gamified system.

Feedback Page

The feedback page will serve as an interactive platform where users can share their thoughts and insights related to events organized by the Singapore Cancer Society, as well as contribute ideas and perspectives about cancer awareness and prevention. The questions featured on this page will be carefully designed and researched to gather meaningful, high-quality responses from participants. By focusing on relevance, clarity, and engagement, these questions will help ensure that the collected feedback can effectively guide future initiatives and event improvements.

To enhance user engagement, the feedback interface will incorporate animated sprites positioned to face each other in a Pokémon battle-inspired format. This layout will simulate a conversational exchange between two characters, creating a sense of dialogue rather than a static survey. The sprites will be configured to visually "interact" with the user's responses, encouraging participation through a playful yet purposeful design. This game-inspired visual setup aims to make the feedback experience more dynamic, memorable, and enjoyable for users, while still maintaining the importance and seriousness of the underlying subject matter. Ultimately, this combination of well-researched questions and interactive design elements will promote thoughtful engagement, foster empathy, and drive actionable insights that can

contribute to the continuous growth and effectiveness of Singapore Cancer Society's outreach events.

Anonymous Cookie Identifier

To maintain user anonymity while still preventing repeated submissions, the system assigns each device a unique, randomly generated UUID that is stored locally in a browser cookie. When a participant first accesses the application, a new UUID is created and saved on the device; no personal data such as name or email is collected or linked to the identifier. During subsequent interactions (such as submitting feedback or completing tasks), the device automatically sends this UUID to the backend, allowing the server to recognise it as the same user. This mechanism enables the system to enforce one-submission rules and detect duplicate attempts, while still preserving full anonymity.

The purpose of this feature is to prevent users from submitting multiple false feedback entries in an attempt to collect additional incentives. This helps maintain the integrity and reliability of the collected results.

About Us Page

Our original design included an Events page intended to display future activities. After consulting with our client, we learned that events are not organised regularly, resulting in minimal content for such a page. Consequently, we redesigned this section into an *About Us* page containing direct links to the Singapore Cancer Society's official website and social media platforms. This ensures users can conveniently access accurate and up-to-date information about the organisation if they are interested.

Admin Dashboard Page

For the next sprint, our focus will be on implementing the suggested improvements and transitioning the dashboard from a static prototype with mock data to a dynamic, real-time system. We intend to integrate the backend with the database to support live data processing and enhance the accuracy of the insights displayed. Additionally, we will revisit and refine parts of the dashboard's customization features to create a more intuitive and adaptable user experience.

Summary of Customer Day 3

Shared the first draft of our prototype and walked through its core features. We received thoughtful feedback highlighting areas for improvement, and we asked several clarifying

questions to better understand expectations, refine the direction, and determine the most effective next steps.
