Progress Since Customer Day 4

Since Customer Day 04, the team has made strong progress in advancing both the application logic and administrative tooling. The storyline of the app has been fully implemented and finalized, providing a clear narrative flow for users. The feedback form has also been restructured to be more gamified — users now choose a cell as part of the storyline, and the ending they receive depends on their selection, making the experience feel more interactive and personalized. On the backend, role-based dashboard access is now enforced: superadmins can access all events and admin controls, while admins can only access their assigned events and event-level dashboard actions. The dashboard also now supports CSV exports (Excel-friendly), hides superadmin-only features like question import and event deletion from admins, and includes a superadmin admin-assignment console. Together, these enhancements significantly strengthen the platform's functionality and prepare it for a more polished showcase on Customer Day 05.

Login Page

A screenshot of a web application's login page. The background is a solid light purple color. In the center, there is a white rectangular box with rounded corners. Inside this box, the title "Dashboard Login" is displayed in a bold, dark blue font. Below the title, a subtitle in a smaller, grey font reads "Admins and superadmins sign in with email and password." There are two input fields: the first is labeled "Email" and contains the placeholder text "name@company.com"; the second is labeled "Password" and contains the placeholder text "Enter your password". Below these fields is an orange button with the text "Sign in" in white. In the bottom-left corner of the purple background, there is a small, dark grey circular icon containing a white letter "N".

Figure 1: Role based access via Login Page

A new dedicated dashboard login page was added for both admins and superadmins using email and password authentication. This creates a secure entry point before users can access events or dashboard features.

Super Admin Dashboard

Figure 2: Super Admin Overall View

The events view is now role-based, so users only see the events they are allowed to access. Superadmins also have extra controls such as the Admin Console and all-events CSV export.

Figure 3: Super Admin Dashboard View

The dashboard now shows role-aware access (for example, superadmin label shown in the header) and supports event-level management/export features. Admins can use assigned event functions, while restricted actions are hidden or blocked.

Assign Admin

N

Figure 4: Super Admin Console View

A new superadmin console was added to assign admin users to specific events. It includes a dropdown to select existing admin users and a checklist of assignable events for easier role management.

Feedback Gamification

Figure 5: Feedback Form Example

Rather than a traditional survey form, the feedback is presented as an RPG-style dialogue. For each question, the Guardian Cell poses a question, and then Cell A and Cell B each offer a response representing different answer options. Cell A's card is styled in purple and Cell B's in green. The user answers by tapping whichever cell's response best matches their experience. A progress bar fills as they move through the questions, and the system automatically advances after each selection.

Figure 5: Screen after completing feedback form

After the final question, the app tallies how many times the user chose Cell A versus Cell B. If Cell A received more or equal selections, the outcome is that Cell A is revealed as the culprit; if Cell B received more, Cell B is captured instead. The responses are submitted to the database, the outcome is saved locally to prevent resubmission. The user is then taken to an outcome scene showing a dramatic reveal image of whichever cell was "captured," along with the vote breakdown.

Figure 6: Social screen, new(left) old(right)

Revamped the entire social screen (previously events screen), changed the events list as the clients only have a few events each year and replaced it with a flagship events list. Added a give and support section, where users can donate to websites which the client lists on their main website. Added a social media section where users can tap and be linked to their social media pages such as their main website, Instagram and Tik Tok.

Translation Feature

Figure 7: Translation Example

We added a translation feature that allows the user to select the language of their choice. For now, the application supports the four common languages in Singapore (Chinese Simplified, Malay, Tamil and English). Selection of the language will be given upon landing on the home screen. Once selected, the translation is reflected across all interactive screens and an example can be seen above.

Next Deliverables

As part of the next development phase, the following enhancements and refinements have been identified to improve overall usability, system robustness, and alignment with the client's branding and analytical needs:

1. User Flow Completion via Confirmation Page

A dedicated confirmation page will be implemented to clearly signal successful feedback submission. This provides users with a definitive end-state, improving clarity and reducing uncertainty in the interaction flow.

2. Feedback Form UI Refinement

The feedback form interface will be enhanced to more clearly distinguish between question prompts and the Cell A / Cell B response buttons. This refinement aims to improve intuitiveness, reduce cognitive load, and minimise accidental mis-selections.

3. Dashboard Analytics Enhancement

The analytics section of the dashboard will be expanded to surface more meaningful insights for event organisers. Planned improvements include:

- Pie chart visualisations showing response distribution per question
- A booth completion rate tracker to measure participant engagement and coverage

These additions will provide clearer visibility into participation patterns and overall event effectiveness.

4. Client Logo Integration

The existing placeholder logo will be replaced with the client's official branding. This change ensures stronger visual alignment with the client's identity and enhances the professionalism of the deployed system.

5. Dashboard Colour Scheme Refresh

The dashboard colour palette will be refreshed to better match the intended branding guidelines. This will create a more cohesive, polished, and professional administrative interface.

6. QR Code Generation within Dashboard

QR code generation functionality will be integrated directly into the dashboard. This enables

organisers to easily generate and share access points for the event without relying on external tools.

7. Question Creator Enhancement

The question creation workflow will be improved to explicitly support the Cell A / Cell B interaction format. This ensures that content creation aligns consistently with the game-based feedback experience presented to users.

8. Codebase Refactoring

A structured refactoring pass will be carried out across the project to improve code readability, modularity, and long-term maintainability. This includes cleaning up duplicated logic, improving naming consistency, and aligning components with best development practices.
