

Pentland Hills International Airport

Our proposal for a new international hub in Central Scotland, called “FuturAir”, is a multidisciplinary project focused on three core principles: a seamless journey, a sustainable landmark, and a future-proof hub.

Sustainability and Environment Strategies

The airport will use renewable energy (wind, hydro, solar), prevent water and air pollution with green tech, and build using eco-friendly, high-performance materials.

Mechanical and Civil Engineering Aspect

Runway design in our layout factors in elevation and temperature. The terminal features a noise-aware layout and a hybrid structure for a sustainable, column-free design.

Computer Science and Innovation

Advanced camera systems enable facial recognition, virtual wayfinding, and crowd analysis, supported by secure local and cloud-based data storage.

Social and Economic Impact

FuturAir will create jobs, support local businesses, and boost regional growth in tourism, retail, and services.
